

LASER ALIGNMENT

Patterson Pump Company is pleased to announce the addition of laser alignment to its Service Department. Alignment services are offered on all new equipment as well as to existing installations. Our team of certified service technicians will provide a turnkey operation at any facility.

Just what does it mean to have your equipment laser aligned? Studies show that between 80-90% of all equipment is misaligned. Many times alignment is completed in the field with merely a straight edge. With laser alignment there is a more accurate shaft-to-shaft alignment, which in turn reduces the errors in the alignment process. This benefits the end user as it increases MTBF, Mean Time Between Failure. Components such as bearings, couplings and shafts are the beneficiaries as failure is kept to a minimum. Proper alignment can also reduce energy costs which means overall cost savings to the customer. Proper alignment could increase the life of the equipment up to 30%.

Why wait?

Why not contact our capable Service Department today and begin to see the benefits for yourself!
